Acne is a chronic disorder of the pilosebaceous unit characterized clinically by the appearance on the face as a rash, combined with a strongly oily skin. In this project etiology and pathogenesis of acne will be developed, and what factors affect it too. What aggravates acne will be developed, specific types, complications and treatment.

The purpose of this work is the approach of acne as a disease of sebaceous, and apocrine sweat glands. Initially, after finding the subject of this project, search for sources began. The sources are books of Dermatology and Venereology, as well as electronic documents after search of the internet.

Terminating the research I concluded that acne vulgaris is a very common skin disease affecting thirty to fifty percent of adolescents of white race. Both sexes are affected, but more often men than women. It was also concluded that there are ways to deal with the disease, having an assertive outcome with the advancement of technology giving many options . One of them is the application of laser.
